#### **About the Dataset**

This dataset is from Bureau of Transportation Statistics. It tracks the on time performance of domestic flights operated by large air carriers. The dataset is for each year and can be downloaded directly from their website. The description is posted on their website in detail.

For this data analysis, we will be using data for the years of 2007 and 2008.

### **Wrangling of Dataset**

```

# What's the structure of the dataset?

The dataset has 29 columns and 9842432 rows.

# What is/are the main feature(s) of interest in the dataset?

The main features are; the factors affecting the delays and cncellations of the flights. These factors will help us to determine the time performace and characteristics of flights of different destinations.

# What features in the dataset will help to support the investigation into the feature(s) of interest?

The main features of interest of the dataset are the factors which are involved in delaying arrival and departure (in time, minutes), cancellation codes and reasons. Also an effort will be undergone for spotting any correlation between parameters.

# **Univariate Exploration**

```
In [7]:
```

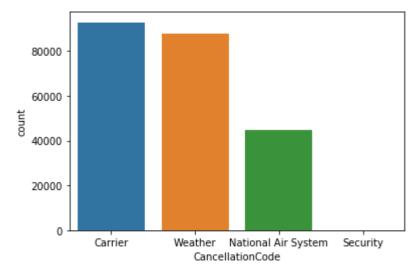

```
df['CancellationCode'].unique().tolist()

Out[7]:
[nan, 'A', 'B', 'C', 'D']

In [8]:

#Define plat (peference: http://alapppyonin.com/visualizations/seabopp/countrlat/countre
```

```
#Define plot (reference: http://alanpryorjr.com/visualizations/seaborn/countplot/countp
lot/)
plot = sb.countplot(x="CancellationCode", data=df)
plot.set_xticklabels(['Carrier','Weather','National Air System','Security']);
```

The avobe graph shows that "Carrier" and "Weather" are the staple reason for the flight cancellation.

# Which Carrier had the most cancellations?

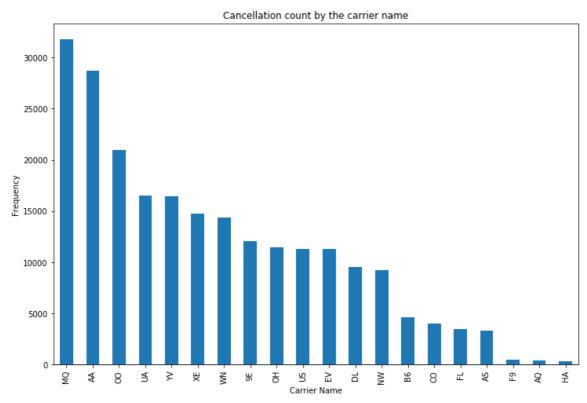

#### In [9]:

```
# creating a DataFrame with carrier and cancellation code
carrier = df.UniqueCarrier.tolist()
cancellation_code = df.CancellationCode.tolist()

most_cancellation = pd.DataFrame({'cancellation_code':cancellation_code, 'carrier': car
rier})
most_cancellation = most_cancellation.dropna()
#most_cancellation
```

#### In [10]:

```
#Define Plot
plt.figure(figsize=(12,8))
fig= most_cancellation['carrier'].value_counts().plot(kind ='bar')
fig.set_title('Cancellation count by the carrier name')
fig.set_xlabel('Carrier Name')
fig.set_ylabel('Frequency');
```

The above bar plot shows that the MQ, AA and OO are the top three carriers with highest cancellation whereas HA is the carrier with lowest cancellations. The cancellation has been considered for the four type of cancellation code A, B,C and D.

# Which carriers had the highest delays? (arrival and departure)

#### In [11]:

```
#To explore delays, we created new dataframes that excluded NaN (missing) values in del
ays to plot histogram.
arrival_delay = df[df.ArrDelay.notnull()]
departure_delay = df[df.DepDelay.notnull()]
```

#### In [12]:

```
# grouping the arrival and departure by Carrier
arrival_delay_carrier = arrival_delay.groupby('UniqueCarrier').ArrDelay.sum().sort_valu
es(ascending=False)
departure_delay_carrier = departure_delay.groupby('UniqueCarrier').DepDelay.sum().sort_
values(ascending=False)
delay=pd.merge(arrival_delay_carrier,departure_delay_carrier,on='UniqueCarrier')
# delay.head()
```

#### In [13]:

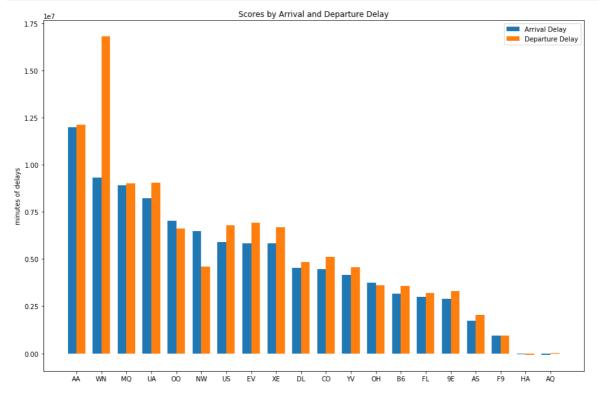

```
# delay.ArrDelay.tolist()
# delay.index.tolist()
```

#### In [14]:

```
#Define Plot
x = np.arange(len(delay.index)) # the carrier locations
width = 0.35 # the width of the bars

fig, ax = plt.subplots(figsize=(15, 10))
rects1 = ax.bar(x - width/2, delay.ArrDelay, width, label='Arrival Delay')
rects2 = ax.bar(x + width/2, delay.DepDelay, width, label='Departure Delay')

# Adding some text for labels, title and custom x-axis tick labels, etc.
ax.set_ylabel('minutes of delays')
ax.set_title('Scores by Arrival and Departure Delay')
ax.set_xticks(x)
ax.set_xticklabels(delay.index)
ax.legend()
plt.show();
```

From the plot it can be seen that (AA)American Airlines has the highest arrival delays. On the contrary 'WN' has the highest Departure Delay.

#### In which month of the year the most cancellations occurred?

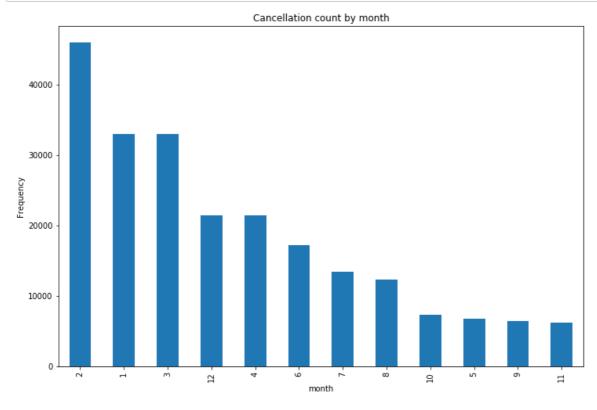

#### In [15]:

```
cancellation_code = df.CancellationCode.tolist()
month = df.Month.tolist()

cancellation_month = pd.DataFrame({'cancellation_code':cancellation_code, 'month': mont
h})
cancellation_month = cancellation_month.dropna()
# cancellation_month
```

#### In [16]:

```
#Define Plot
plt.figure(figsize=(12,8))
fig= cancellation_month['month'].value_counts().plot(kind ='bar')
fig.set_title('Cancellation count by month')
fig.set_xlabel('month')
fig.set_ylabel('Frequency');
```

It can be seen that the first three months see the major cancellations whereas 2nd month has the most. In January and March the cancellation were almost same.

# What does the distribution of arrival delays and departure delays look like?

#### In [17]:

```
# recalling previously used dataFrame
arrival_delay = df[df.ArrDelay.notnull()]
adelay = arrival_delay.ArrDelay
adelay.head()
```

#### Out[17]:

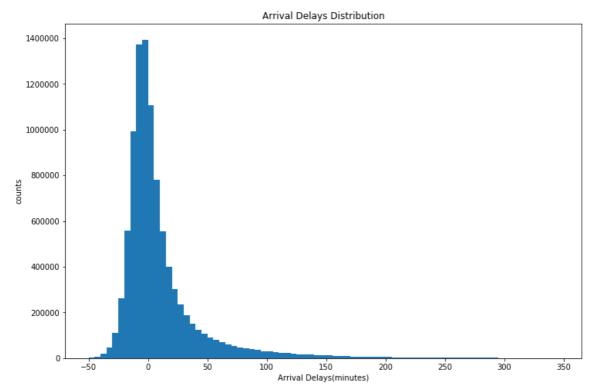

0 1.0 1 8.0 2 34.0

3 26.0 4 -3.0

Name: ArrDelay, dtype: float64

#### In [18]:

```
#Define plot
plt.figure(figsize=(12,8))
plt.title('Arrival Delays Distribution')
plt.xlabel('Arrival Delays(minutes)')
plt.ylabel('counts')
plt.hist(adelay,bins=np.arange(-50,350,5));
```

From the histogram we can see that most of the delays are concentrated between 0 and 50 minutes. The distribution is skewed to the right.

#### In [19]:

```
#Filtering only data with departure_delay information, excluding NaN
depart_delay=df[df.DepDelay.notnull()]
ddelay = depart_delay.DepDelay
ddelay.head()
```

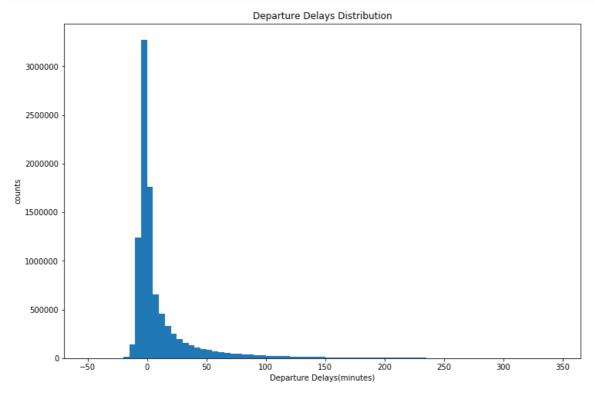

#### Out[19]:

0 7.0 1 13.0 2 36.0 3 30.0 4 1.0

Name: DepDelay, dtype: float64

#### In [20]:

```
#Define plot
plt.figure(figsize=(12,8))
plt.title('Departure Delays Distribution')
plt.xlabel('Departure Delays(minutes)')
plt.ylabel('counts')
plt.hist(ddelay,bins=np.arange(-50,350,5));
```

The histogram above shows the distribution of departure delays. From the graph, it can be observed that most of the delays are between 0 and 50. The graph is skewed to the right

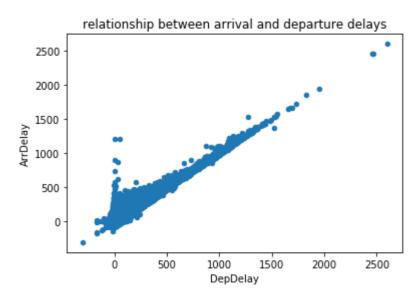

# **Bivariate Exploration**

# What is the relationship between arrival and departure delays?

#### In [21]:

```
#Define Plot
plt.figure(figsize=(14,8))
df.plot.scatter(x='DepDelay', y='ArrDelay')
plt.title('relationship between arrival and departure delays')
plt.show();
```

<Figure size 1008x576 with 0 Axes>

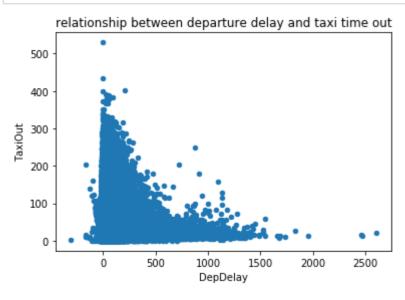

There is a linear realationship between departure and arrival delays. With the increase of Arrival delay, departure delay is also increasing.

# Is there any relationship between departure delay and taxi out time?

#### In [22]:

```
#Define plot
df.plot.scatter(x='DepDelay', y='TaxiOut')
plt.title('relationship between departure delay and taxi time out')
plt.show();
```

There is no linear relationship between departure delay and taxi out time. The data at the left on the graph shows that, there is no effect on departure delay as the delay for Taxi Out increased.

## What is the Fight performance of the carriers in terms of arrival delays?

#### In [23]:

```
#Getting a dataframe with number of flights that were delayed and not cancelled by each
carrier

df_depart_delay=df[df.DepDelay.notnull()]
arrival_delayed=df_depart_delay.query('Cancelled==0 & ArrDelay>0').groupby('UniqueCarri
er').size().reset_index(name='delayed_flights')

arrival_delayed.head()
```

#### In [28]:

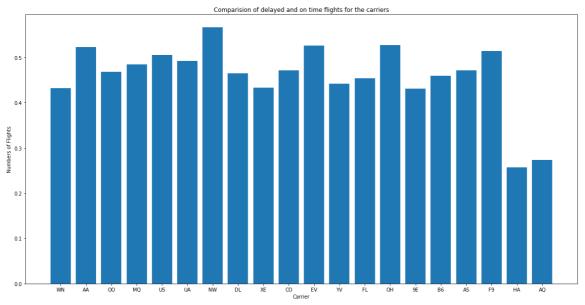

```
# Define plot
ax = df1.plot.bar(figsize= [16,12], rot=90)
plt.xlabel('Carrier')
plt.ylabel('Numbers of Flights')
plt.title('Comparision of delayed and on time flights for the carriers')
plt.show()
```

It is visible that the carrier 'WN' has conducted more flights and they have the highest number of delays as well, next plot the percentage will be showen.

#### In [29]:

```
# Define plot
plt.figure(figsize=(20,10))
plt.bar(list(df1.index), df1.ratio)
plt.xlabel('Carrier')
plt.ylabel('Numbers of Flights')
plt.title('Comparision of delayed and on time flights for the carriers')
plt.show()
```

So, it is now clear that the highest percentage of delays has been occured in the carrier named 'NW'.

# Is there any relationship between the flight delays and destination?

#### In [30]:

```
# getting information for destination based flights that has delayed but not cancelled
df_depart_delay=df[df.DepDelay.notnull()]

0	ABE	3347	7054
1	ABI	1743	3601
2	ABQ	24599	54298
3	ABY	901	1693
4	ACK	164	282

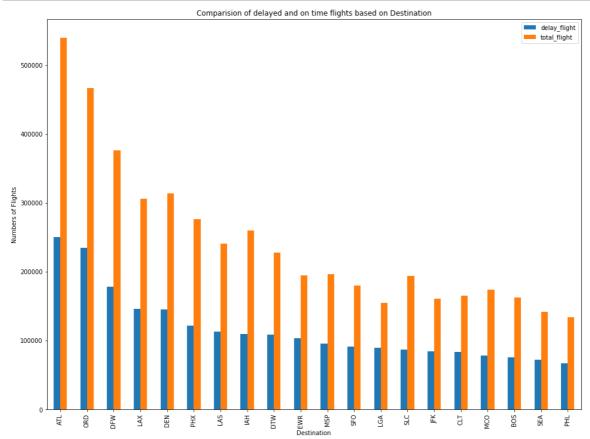

#### In [33]:

```
df_merged_dest_sort = df_merged_dest.sort_values(by =['delayed_flights', 'total_flight
s'], ascending = False)
top_20_destination = df_merged_dest_sort.head(20)
```

#### In [34]:

```
# changing the index as Destination
dest = top_20_destination.Dest.tolist()
delay_flight = top_20_destination.delayed_flights.tolist()
total_flight = top_20_destination.total_flights.tolist()

df2 = pd.DataFrame({'delay_flight':delay_flight, 'total_flight':total_flight}, index =
dest)
df2.head()
# Define Plot
ax = df2.plot.bar(figsize= [16,12], rot=90)
plt.xlabel('Destination')
plt.ylabel('Numbers of Flights')
plt.title('Comparision of delayed and on time flights based on Destination')
plt.show()
```

The figure above gives an overview of top 20 Desitinations where the flights has conducted on Time and delayed. The highest number of flight has been conducted in 'ATL'(Atlanta, GA: Hartsfield-Jackson Atlanta International) and the delayed number of flights is also higher in 'ATL'. It's pretty interesting all the destinations has a delayed number flights which is almost the half the number of total flights conducted for respective destinations.

# **Multivariate Exploration**

# Is there any relations between the AirTime and the flight delays? Are long distance flights prone delay more than that of small distance Flights while conducting Flights? [long/small distance flights(in time)]

#### [<matplotlib.lines.Line2D at 0x22152d67248>]

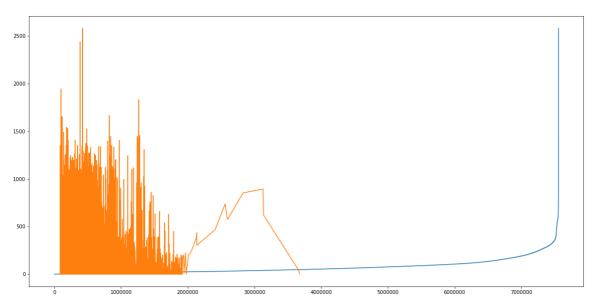

The figure above shows the regression line for each delays with resepect to Air Time. It can be observed that at the end of the dataset there are some outliers for which the regression line has gone up suddenly. It is also observable that the delays are in gerneral acute in those flights where the AirTime is less and delays are decreasing as the AirTime increases.

#### In [45]:

```
# Define Plot (original Carrier delay vs the regression line for Carrier Delay)
plt.figure(figsize=(20,10))
plt.plot(cd)
plt.plot(df3.AirTime*(len(cd)/max(df3.CD)),df3.CD)
```

#### Out[45]:

#### [<matplotlib.lines.Line2D at 0x22153104648>]

The figure shows the comparision between the regression line for carrier delay and carrier delay with respect to the AirTime. It is seen that delays are more acute in the flights where the AirTime is less. For example, the figure for the carrier delay has been shown, but other delays can be compared with regression line as well.
